Sono state varie opinioni, se ogni grado di Direzione importi Vn'anno, ò più, ò meno, imperoche ci sono quattro opinioni &

La prima è stata d'alcuni, che hanno pensato, che si deua guardare quanto si muoua per l'appunto il ☉ in quell'istesso giorno, che l'huomo è nato, e quel tanto, che egli si muoue, importare vn'anno, come per esempio, se egli si muoue M. 57. 8. questi m: 57. 8. importare per l'appunto vn'anno &

La seconda, che si deua ragguagliare quanto egli si muoua in capo alla fine dell'anno, compensando il più con il meno, e si muouerà ragguagliatamente: M. 59. 8. Li quali M. 59. 8. vogliono, che importi vn'Anno per l'appunto. &

La terza, che si doueus guardare come si muoua dell'equinoziale, della quale è stato il Magini.

La quarta, che è la più usata di tutte, forse per la difficultà, et fastidio le predette nel calcularsi, è stata, che ogni grado importi vn' Anno per l'appunto.

La prima opinione pare la più probabile di tutte, essendo stata osseruata infinite volte, e trouata vera. Et oltre à queste esperienze ci s'aggiugne l'autorità del Bierns, che dice, mentre parla di questo, Motus ☉, qui tunc est, refertur ad annum. Di modo che, bisogna vedere quanto si muoua il ☉ in quel giorno

che uno è nato, e quel tanto importerà giusto un' anno.
Il che segue non solo nelle Direzioni del ☉, ma di qualsivoglia Stella.
Il med.° moto diurno, dove nelle Direzioni della Natività importa un' Anno, nelle direzioni delle Revoluzioni importa un giorno, come dice Schonero.

Per trovare q.to si muova il ☉ in qualsivoglia grado, e segno, ch'egli si trovi, poi che l'effemeride non sono mai esquisite, è stata calculata questo moto secondo Ticone dall'Ecc.mo S. D. Pierini, è stata ridotta in q.a tavola; la quale s'adopra a q.o modo.

Piglisi il gr: finito, che ha il ☉, e se passerà mezo quell'altro, cioè oltre a M: 30. piglisi il gr: seguente, et entrisi nella p.a colonna, che in testa è contrasegnata G, che contiene i gradi, che ha il ☉ ed poi vadisi sotto 'l segno, nel q.le si trova il ☉ dirimpetto al numero del grado del ☉, e quivi si troverà il moto diurno.
V.g. Il ☉ è in ♊ 17. gr: ~~di ♊~~ et è V.g. in ♊ entra con 17 nella Colonnetta de gradi, e poi va sotto in ♊, e guarda dirimpetto al gr. 17. e vi trovi M. 57. 12. il quale num.ro sarà il moto diurno del ☉. Ma bisogna guard.re di calcular bene i gradi di ☉, perchè si potrebbe pigliare errore grandiss.o &c.

Dipoj s'entra nella seguente tauola a 60 e si piglia cq.ta maniera:

Per esempio io uoglio calcolare p l'anno 1616. Agosto. nel mezzo di
delli dieci, trouo G: 1 17. 53. 13 d. ☉. entro di poj nella d.a tauola a 60
e sotto cancro piglio 20, come a' num.o più vicino al grado 17. di ☉,
il che si deue osseruare, cioè di pigliare quel num.o che è più vicino
al grado, et nel q.le si troua il ☉. Dipoj uo a quella colonna,
che è piglio quella colonna, che è sotto al d. n.o 20. entro di poj
nella d.a colonnetta, che c'è gli anni, che si calcolano, e trouo appresso
l'anno 604 cioè, se uoglio calcolare 1616. piglierò, 16, e 8
e trouo il n.o diminuto nella d.a colonna, che sarà 5. 39",
